Interim COVID-19 infection control guidance for workers providing in-home personal care

Purpose

This guidance applies to:

- In-home care agencies licensed under ORS 443.305-443.350; and
- Individuals providing in-home personal care where no individual or agency license is required under state or federal law.

In-home care agencies are required to:

- Train and educate their caregivers about the symptoms of COVID-19 and the proper use of personal protective equipment (PPE).
- Prohibit caregivers with COVID-19 or symptoms of COVID-19 from providing in-home care services until they are free of fever and any other symptoms for at least 72 hours (without the use of fever-reducing medicines or cough suppressants).
- Provide appropriate PPE for its caregiver employees.
  - If employers cannot obtain PPE through usual means, they should contact their local public health authority for assistance.
  - PPE may not be reused and must be disposed of immediately after use.
  - Train caregivers to clean hands immediately after touching or removing PPE and after contact with respiratory secretions, clean hands with soap and water or alcohol-based hand sanitizer.
- Ensure that caregivers wear a mask appropriately. The mask should cover mouth and nose securely to minimize gaps between the face and the mask. While in use, avoid touching the mask.
- Require that clients wear a mask or other face covering while caregivers are in their home unless they have a medical condition that prevents use of a mask or face covering.

In-home caregivers are required to:

- Wash hands often with soap and water for at least 20 seconds or use an alcohol-based hand sanitizer (60 to 95% alcohol content), covering all surfaces of the hands and rubbing them together until dry. Soap and water should be used if hands are visibly dirty.
• Stay home if they have tested positive for COVID-19 or have COVID-19 symptoms until they are free of fever and any other symptoms for at least 72 hours (without the use of fever-reducing medicines or cough suppressants).

In-home caregivers should:

• Avoid touching eyes, nose, and mouth with unwashed hands.

• Cover coughs and sneezes using a flexed elbow or a tissue, not hands. If using a tissue, throw tissue away right away and wash hands.

• If you experience symptoms such as fever, coughing and shortness of breath do the following:
  ▪ Do not enter clients home if possible.
  ▪ Stay home and contact your provider to discuss whether you should be tested for COVID-19. Inform your provider that you provide healthcare for vulnerable populations.

• Clean all “high-touch” surfaces, such as counters, tabletops, doorknobs, bathroom fixtures, toilets, phones, keyboards, tablets and bedside tables, every day. Also, clean any surfaces that may have blood, stool or body fluids on them. Use a household cleaning spray or wipe, according to the label instructions.

• Use appropriate PPE, do not reuse PPE and dispose of PPE immediately after use.

• Limit time with clients when together in an enclosed space.

• Make sure that shared spaces in the home have good airflow (e.g., an air conditioner or an opened window, weather permitting).

• Minimize face-to-face interactions with the client and maintain a distance of at least 6 feet from the client to the extent possible.

• Assist and remind the client to practice good hand hygiene and cough etiquette.

• If close contact with an ill client cannot be avoided, follow standard infection prevention practices as recommended by the CDC.

• Assist clients in gathering resources they would need to stay at home for up to 2 weeks if they become sick or need to minimize contact with others (such as medication refills).

• If a client is ill:
  ▪ Contact the client’s health care provider and case manager, if applicable, or other support agencies to find alternative ways to support them.
  ▪ Postpone non-essential in-home visits until symptoms resolve.
  ▪ Increase services provided by phone or online, if possible.
